

Hydric Resource Policy

Under our strategic framework of action, which is committed to sustainable development, managing hydric resources is fundamental to ensuring the sustainability of our Organization and the communities with whom we live and work. Our commitment to face the problems surrounding the sustainability of water consists in developing our corporate performance and our businesses, focusing on the following fundamental principles:

- Promoting the human right to water, with special emphasis on basic sanitation and access to clean drinking water.
- Guaranteeing that our direct operations use water efficiently, incorporating technological efficiency practices for its use, reuse, recirculation, reduction of consumption, and the optimal treatment of industrial discharge.
- Active participation in the management program for basins affected by our operations, motivating conservation projects that promote diversity and the balance of ecosystems.
- Promoting culture and practices that stimulate companies, our collaborators, and society in general, particularly good practices for the sustainability of water.
- Participating in public policy dialogues to promote actions directed towards the sustainability of water.
- Managing our relationship with direct suppliers, ensuring that we motivate them and raise awareness of good practices with water management, improve the relationship between different areas of the company, and share mutual knowledge and experiences.
